

MONEY SAVING TIPS

WEEKLY CHECKLIST

- ✓ **Make sure you have a high-efficiency pleated air filter installed on your heating and cooling system to effectively filter the air that comes in and out of the system. This prevents dust and other debris from getting inside the system, which can cause damage.**
- ✓ **Remove leaves, grass and other debris from around the outside unit of your HVAC system.**
- ✓ **Your outside unit should be located a good distance away from trees and plants to ensure no leaves and debris will accumulate and block the necessary airflow that the system needs.**
- ✓ **Furnace humidifier – This should be turned off and drained of condensation water during summer. During fall, however, you should replace the humidifier filter and turn on the water.**
